

Rafael Sani Valentino Prahastra

Computer Science Student | Backend Systems & Cloud Infrastructure

rafaelprahastra@gmail.com

<https://rafael-prahastra-portfolio.vercel.app>

PROFESSIONAL SUMMARY

Computer Science student focused on backend systems and cloud infrastructure, with hands-on experience building Python applications, transactional SQLite workflows, Discord automation, Linux VPS deployments, and AI-assisted development workflows. Seeking an internship or junior software opportunity.

EDUCATION

BINUS University

Computer Science - Current student

Relevant coursework: Algorithm and Programming, Object-Oriented Programming, Scientific Computing, Computational Physics

TECHNICAL SKILLS

Backend: Python, async/await, asyncio, discord.py, modular architecture, API integration

Data & testing: SQLite, transactional workflows, rollback handling, mock-based testing, Pytest

Infrastructure: Ubuntu Linux, VPS operations, SSH, SCP, systemd, Tailscale

AI-assisted development: Codex, ChatGPT, Cursor, Trae, repository instructions, scoped agent workflows

Academic web work: HTML, CSS, JavaScript, React, Tailwind CSS, LocalStorage, heuristic logic

PROJECTS

SimbaBlox Marketplace Bot

Primary developer - Backend & infrastructure | V1 in use; V2 rewrite in progress

- Developed modular Python and discord.py workflows for marketplace tickets, seller verification, reputation, statistics, and administration.
- Worked on transactional SQLite accounting paths, duplicate handling, and ticket-state validation; used temporary databases and mocks for isolated testing.
- Deployed and operated V1 on an Ubuntu VPS using systemd, SSH, and Tailscale; kept the V2 rewrite separate from production data.

Automm Escrow - AI-Assisted Development Workflow

Workflow design | Architecture experiment

- Structured reusable repository instructions and role-specific agent configurations to separate planning, implementation, and review.
- Used scoped tasks and shared context to support repeatable development, without claiming autonomous financial execution or measured performance gains.

Human-Centered Smart Space

Academic prototype development

- Worked on a React and Tailwind CSS single-page prototype for room-planning recommendations using heuristic rules and LocalStorage.
- Explored accessibility, privacy, collaboration, and sustainability as design inputs; the recommendation mechanism is rule-based, not trained machine learning.

CURRENTLY LEARNING

Docker and Docker Compose, cloud-native systems, computational physics, scientific computing, ML/LLM integration
